Question 2

A population of sunflower plants is described as having a monthly growth rate that follows a normal distribution with $\mu = 3.08$ in and $\sigma = 0.40$ in.

Use this information to answer the following questions.

(1 point possible)

2a. What is the probability that a randomly chosen sunflower plant grows more than 3.2 inches in a month? *(Round to 3 decimal places.)*

0.618

0.618

Answer: 0.382

(1 point possible)

2b. A middle-school science class grew 25 of these sunflowers. How many inches would they expect these flowers to have grown, on average, one month later? *(Round to 2 decimal places.)*

3.20

3.20

Answer: 3.08

(1/1 point)

2d. The science teacher notices that the average monthly growth of her 25 sunflowers has never exceeded 3.2 inches. What should she conclude?

- ☐ About 38% of her samples should have an average growth of 3.2 inches or more, so something is wrong with her data.
- ☐ Her data suggests that the original growth parameters given for this sunflower population must be wrong.
- ☒ We wouldn't expect to see an average monthly growth of 3.2 inches for a sample of 25 plants. Her data is probably fine. ✓
